

Closing the gap between breast & bottle.

The first bottle designed to emulate a mother's anatomy by replicating the nipple, areola and breast, in form, function and feel.

The Emulait bottle minimizes the risk of nipple confusion and bottle preference, creates a seamless transition from breastfeeding to bottle feeding and back, supports prolonged breastfeeding, and ensures a better feeding experience for all.

Emulait is a better option for those combining breastfeeding and bottle feeding, or those exclusively bottle feeding.

The Emulait Difference

The shape and color of a real nipple.

Emulait nipples are tailored to your anatomy. We match color as well as shape to ease the transition between breast and bottle, and minimize the risk of nipple confusion.

The texture and feel of a real nipple.

Flesh-like in both softness and texture, Emulait nipples replicate the texture of stimulated areola glands, with interior fibers to mimic milk ducts.

The elasticity of a real nipple.

Created to simulate the elasticity of a real nipple, Emulait nipples stretch and elongate during feedings, allowing babies to strengthen their jaw muscles for proper oral development.

The reduction of air intake.

Commonly referred to as 'anti-colic,' Emulait nipples regulate pressure and reduce air swallowing (aerophagia) to minimize gas, stomach discomfort, and fussiness.

The milk flow rate of a real nipple.

To replicate how a mother's nipple extracts milk, Emulait nipples have multiple holes on the tip and sides, and a flow rate control valve to mimic a natural breast milk letdown.

A bottle designed like a real breast.

The breast-shape design of the Emulait Anatomy Bottle creates a natural baby-to-breast positioning during feedings, provides better eye-to-eye contact, and facilitates responsive feeding.
