

# MeasureUp

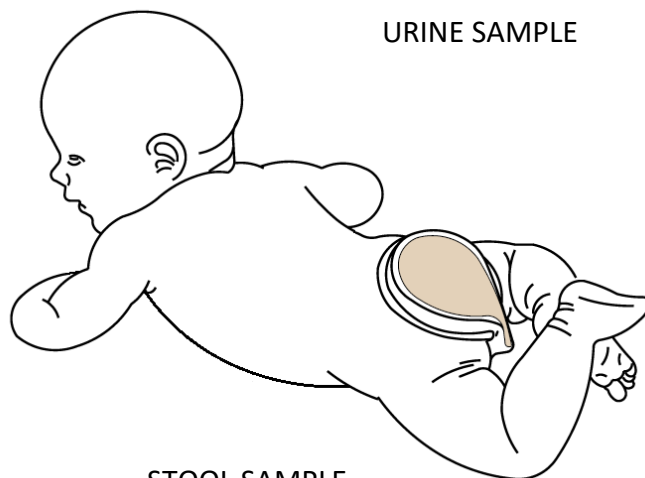

MeasureUp is a comprehensive medical device used for urine and stool sample collection in 0-3 years old children. It prevents sample cross-contamination by isolating the two regions apart.

A single device can be used for either urine or stool sample collection. Two of such devices could also be attached together to sample urine and stool simultaneously without cross-contamination.

This device is secured to the skin with a gentle and conformable medical-grade silicone adhesive. It also features a removable foam insert that quickly absorbs liquids and could be rinsed out to acquire the sample.
